For the testing stage I have gotten rid of the click by making sure my envelope doesn't disconnect. I also added a test background to make sure I can do it and moved my text around to format it in the html. I also changed the default values of the delay time(to 0), overdrive(0), Reverb wet/dry(to 0), and feedback gain (to .35). I made the feedback gain still on since it's connected to the main gain control, I also changed the range from 0-1 to 0-.68 because after .68 it would clip and crash the audio. I want to finish the background image and move some things around but my code is looking pretty good and close to the final stage.
